

Group Number: 2

Features:

- Recipe Display
- Favorited Recipe
- Home Page
- Data pull from API

Things that worked:

- HTML files are linked and when a picture of a recipe is clicked gives the recipe information
- Data from Spoonacular API is pulled and is able to be parsed in a json file
- HTML classes and clickable things work as they should

Issues:

- Learning how to work pug into our front end to work as an integration layer, and building up components/including them within multiple files
- MongoDB vs postgres/sql database for use with API calls that pull individual json files with changing ingredient amounts
- Learning how to grab and post data that changes/working with nodeJS.

Suggestions:

- Use pug to make templates for our pages
- Use MongoDB to store JSON files since the amount of ingredients is not static
- Create node js server and print hello world from the node js server
